

Thermal Imaging

Thermal Imaging Technology Used for Moisture Detection in Buildings and Residences

Introducing the revolutionary IR FlexCam® The new IR FlexCam® is fully radiometric, portable, video rate infrared camera that combines unprecedented ease of use with advanced functionality.

Combined with the use of traditional moisture sensors and our state - of - the - art restoration equipment thermal imaging is breaking new ground in customer satisfaction.

Each area effected can be examined for moisture levels before even through walls, insulation and carpet to identify and give a precise estimate of the extent damage.

After restoring duplicate images are clear, visual proof of a job that is well done.

Don't settle for estimates and work based on guessing from out-dated equipment. You can KNOW that the job is fully restored using the latest infrared technology.
